Neural Headline Generation

Our challenge in news-aggregator in Yahoo! JAPAN

Condensed headline is used to be shown in the Yahoo! JAPAN website as a hyperlink to a news article instead of the original headline and to allow its visitors to swiftly determine if they should read the article. Editing assistant system which shows candidates of condensed headline to editors would be useful.

Condensed headline generation with encoder-decoder model

Recent automatic summarization systems depend heavily on machine learning which based on a lot of training examples. However, <u>since the condensed headlines are manually written by human workers in addition to their original headlines, making them is costly, and therefore it is not easy to prepare them in large quantities.</u>

Condensed Headline Original Headline Y!= \- \ YAHOO ログイン 🎲 🗏 かつては食用、貴重なタンパク源だった 巨大カタツムリと巨大タニシのいま **879** 中縄に行かれたことの る読者なら、とても大 きなカタツムリが島に生 息しているのを目撃した とがあるのではないで ょうか? 本土で身近 に見かけるカタツムリと 違って、紡錘型の巻貝を 野良猫に餌やり禁止 賛否続々 供) 🕝 拡大写真 背負っており、殻の大き さは最大20センチメート トルコ最大級の地下都市発見 ル、体長も伸びれば20センチメートルを超える 大物です。 150年ぶり サボテン新種発見 町民より多い伊豆大島のキョン 都が根絶目指し 前年度比1.4倍の4億円予算化

Our contents partner provides articles (right) to us. Yahoo! JAPAN news editor team adds information such as related links to it, writes condensed headline which is 13 and half or less characters (13 multibyte characters and one singlebyte character) and displays it to the top page of Yahoo! JAPAN.

Proposed Method

Step 1. Train baseline model

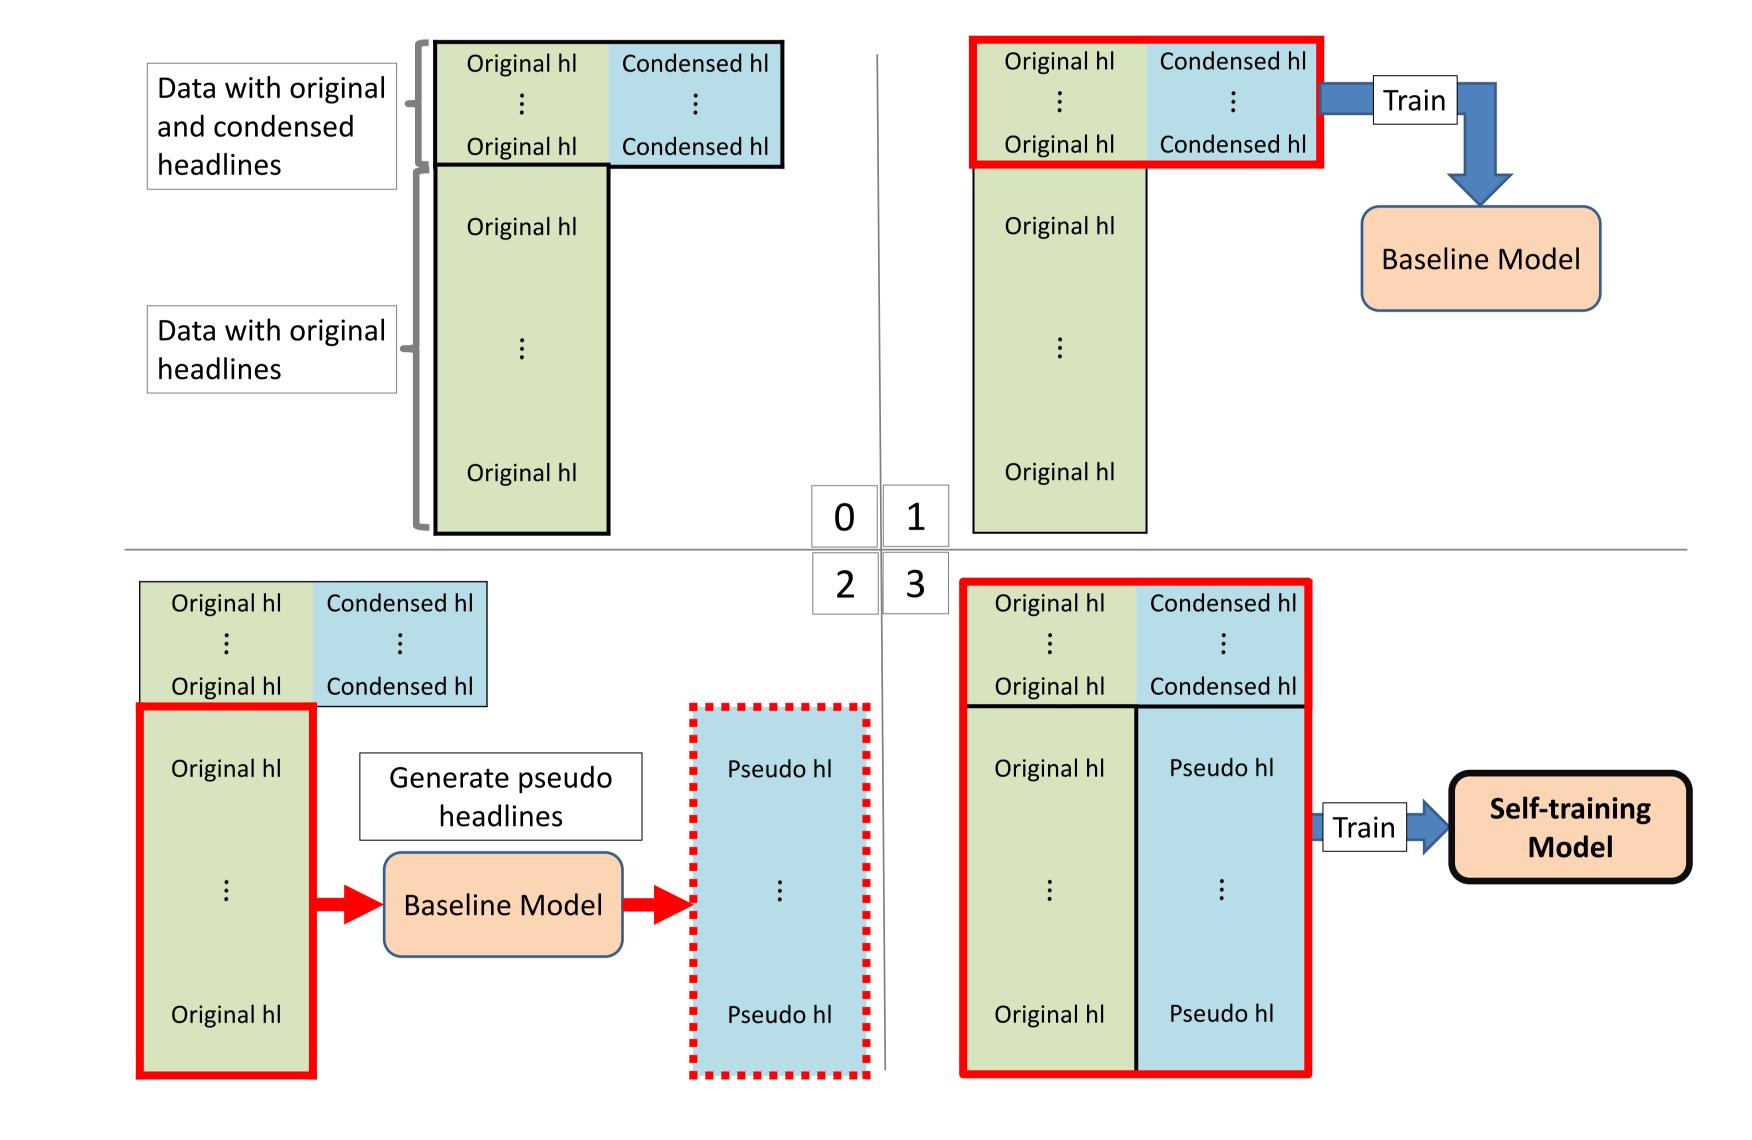

A baseline model is learned from pairs of headlines and their corresponding condensed headlines.

Step 2. Generate pseudo headlines

We run the baseline model to generate pseudo condensed headlines from the headlines without condensed ones.

Step 3. Train proposed model

Our proposed model is learned from both original and pseudo condensed headlines.

Experiments

♦ Implementation and settings

- Generate condensed headline from original one
- Baseline method employs basic encoder-decoder model with an attention mechanism (with LSTM, character based). Developed with OpenNMT-Toolkit.

♦ Data

- Original and condensed headlines: about 100K
 - Split into: Training 60%, Validation 20%, Test 20%
- Original headlines: 2M
- Compare number of unlabeled training examples from 200K to 2M

♦ Compared method

- Baseline method
- Pre-training method [Dai and Le, NIPS 2015]
- Proposed method (with 600K unlabeled headlines)

Original Headline Gold Standard Baseline (ROUGE-1) Proposed (ROUGE-1) ソフトバンクがロボット事業に参 入、日本のロボット産業どうな 日本ロボットロボットに参入 ソフト B ロボット事業に参入 日本のロボット産業 未来は? (0.462)(0.385)Robot industry in Japan – future? ROUGE-1 result

| | ROUGE-1 |
|-------------------------------------|---------|
| Baseline | 0.571 |
| Pre-Training(w/o attention weights) | 0.520 |
| Pre-Training(all weights) | 0.503 |
| Proposed (600K) | 0.574 |

Discussion

- Known problem in self-training
- Too much unlabeled training examples generated from an initial model overwhelms the labeled examples (right figure). This implies that if we could filter out the inferior training examples and choose only good training examples, we could improve the accuracy.

◆ Results

(p<0.05)

Proposed method significantly

overcame baseline method.

- Consideration of news description
- Human editors carefully read the body of articles as well as their headlines in order to make their condensed headlines, and therefore information written in the body should also be considered to generate better condensed headlines.
